Credit Name: Computer Science 3
Assignment Name: SchoolInput

Error Log Entry

What error message did you encounter (if any)?

What unexpected behavior did your program exhibit?

-Logic: My code was not printing the school or grade selected even though I had the line in my code to pull whatever was put into the combo box. Instead the output said "combo Box" with the bounds

-Runtime/Compatibility issue: My image for western was not appearing when I would run my code.

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

- It ws a logic issue
- It was a compatability issue

Include a screenshot of specific lines of code.

How did you fix the issue?

- I had to add a variable before I called on the value entered because what was happening was instead of grabbing the number or school name it was literally outputing the enitre Combo Box.

-Even though the code was structured properly and there were no errors highlighted in the code. I had to find another image of the western logo that was a png in order for it to run the code entirely.

Provide the corrected code or solution using a screenshot.

//I did not get any screenshots while writing the code and I couldn't recreate the errors without messing up my code, so I have done my best to describe the errors and corrections and I will remember to keep track of errors throughout writing my future codes.
