Credit Name: Computer Science 3
Assignment Name: BreakAPlate

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

- I started by laying it out visually and deciding how I wanted my version of the game to work. Then I began making out the visual aspect so everything was laid out properly before moving on the adding events and actions.

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

- I don't think I found anything particulary confusing at first, I just had to make sure I understood what the problem was asking of me before I started.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

- Yes, I started with the design and layout of it, then moved on to adding events and actions. However, I mostly completed all the coding per lable or textfield before moving on to the next one, that way I made sure everything was working properly and if something was wrong I knew where the issue was.

How did you decide on the tools, data structures, or algorithms to use?

- I created a GUI, using components like buttons, lables, and text fields to make the program interactive. I had to use variables and loops in order for my code to output a different prize per attempt.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

- I finished my code in sections, making sure each component worked before moving on, that way I could lower my errors.

How did you test your solution along the way to make sure it was working?

- Everytime I got to a point that could be checked visually I would run my code and make sure all possible outcomes worked, even if it wasn't totally finished yet. For example, before adding any images for prizes I just put in text as the output so I could make sure my code was running as it was meant to.

Overcoming Challenges

What part of the problem was the most difficult for you?

- One of the problems I had was with my loop, instead of getting rid of the prize for the previous attempt it was combining the new attempt to the old prize which then made the output inaccurate, so I had to add to my loop and make sure that if the user went to play again it would clear any of the images or text in the lable.

How did you handle moments when you felt stuck or unsure of what to do next?

- Luckily my peer and I were working on the same assignment at the same time so anytime we had an issue we would compare our codes and try to single out the error, and if we could not figure it out I would have to ask the teacher for some guidance.

Learning

Was there anything you learned that you think will help you with future challenges?

- One thing I learned from making a GUI was how to break a larger code into smaller parts. This will help me in future coding challaneges because I have practiced focusing on solving one problem at a time, testing each part, and fixing errors more consistently.
