Credit Name: Computer Science 3
Assignment Name: SchoolInput

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

- Just like my other assignment I started by laying it out visually and then moving onto the code. Because there wasn't a whole set of instructions just a image on d2l, I really had to analyze what I was meant to be doing before I attempted the code.

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

- I don't think there was anything initiallly about this assignment that confused me.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

- I broke up the code into smaller steps by laying it out first I could visualize how the code should run and what needed to be completed in what order.

How did you decide on the tools, data structures, or algorithms to use?

- I used the textbook to help me call upon the user inputs that way I only had to write a if statement for the image output not evey single input. I used a combination of text fields, combo boxes, labels, and a button to make this code easy to use and easy to understand.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

- I worked on this code in sections, making sure each label, text field, button and combo box worked properly before moving on to the next thing. But I tried to avoid skipping over any parts that confused me in order to avoid later mistakes.

How did you test your solution along the way to make sure it was working?

- Just like my other assignment I would run the code at any possible time so I could check that everything was running properly and that I wasn't missing anything. I would do this by finishing a section and then running it to see if it was outputting everything it needed to.

Overcoming Challenges

What part of the problem was the most difficult for you?

- I got confused while using a new way to call on the inputs from the text fields and combo boxes, because I had never used it before I was running into a lot of syntax errors and then eventually a logic error that ended up making my code output the entire combo box instead of just the contents of that combo box. However, I eventually got it to work after some trial and error and even though it took me longer it made my code cleaner and e

How did you handle moments when you felt stuck or unsure of what to do next?

- Again my peer and I were working on this project at the same time so we would frequently ask for help and compare codes when we would get stuck or confused. If we could not figure it out we asked the teacher for some guidance.

Learning

Was there anything you learned that you think will help you with future challenges?

- Since there was a lot of components in this assignments I think it helped me learn how to make those different components work together which I believe will be helpful when it comes to more difficult and layered projects in the future.
